Given Three integers n, a, b return n^{th} magical no
Ans may be very large return 10^9+7 (%)

Magical No: → If no either divisible by a or b
n = 1, a = 2, b = 3, Output → 2

→ Optimal
→ Find L.C.M. of a and b.
lcm = a*b / gcd (a, b).
→ Apply Binary Search
low = min(a, b).
high = n * min(a, b).
while (low < high) find mid = low + (high - low) / 2.
check mid is magical
magical Count = mid/a + mid/b - mid/lcm

if magical Count ≥ n
high = mid;
else if (magical Count < n)
low = mid + 1

low will be the ans.
do ans % 10^9+7

T.C. O(log(n * min(a, b)))

Code: →
```
while (low < high) {
    int mid = low + (high - low) / 2.
int magicalcount = (mid/a) + (mid/b) - (mid/lcm)
if (magical count ≥ n)
    high = mid;
else
    low = mid + 1.   //then output return ans%(10^9+7)
```

→ Brute Force

```
int low = min(a,b);
int high = min(a,b);

for(int i=low ; i <= high ; i++) {
    if (i % a == 0) counter++;
    else if (i % b == 0) counter++;

    if (counter == n) {
        return i % (1e9+7);
    }
```
